

Integrated Pest Management (IPM)

Integrated Pest Management is a landscape maintenance program that reduces the amount of pesticides used on your trees and shrubs.

A Certified Arborist inspects your property during the growing season, spraying your landscape for insect problems as needed and reports to you any pertinent observations. A foliar fertilization may be applied to weak plants.

The benefit of having an IPM program for your landscape is that we can provide you with timely visits from one of our Certified Arborists. This allows us to spray any trees or shrubs that we find problems with before infestations can build up to critical levels. It also helps to take some of the pressure off of yourself from monitoring your own landscape.

By allowing us to routinely inspect your trees and shrubs, we can provide you with an excellent preventative maintenance program and give you healthier and more attractive trees and shrubs.
